## Z.C ASSEMBLED QUILLS

*Z.C. Quills are pre-assembled cutting sets made up of circular knives, metallic spacers and vulcanized spacers. Their main application is for cutting great tonnages of slit strips which are thin and have fixed widths.. Even more the higher the quality requirements are. These complete units remain assembled from the moment they are mounted, during their successive sharpening and until the end of their useful cutting life.*

*The fitting of these Z.C. quills is carried out by means of a simple but effective guide system consisting of three guide knives. That guide system allows maintaining the horizontal clearance, fixed in the design of the quills invariable all its life long.*

*The mounting is carried out extraordinarily quickly, being one of the quills axially fixed while the second is fitted to the first with no other additional fastenings.*
